

Mammals of the World checklist, April 19, 2011.

VLADIMIR DINETS

Notes:

1. This checklist was created and is irregularly updated for personal use. I can bring it up to the standards of a scientific publication, but that would involve a lot of work which I am not prepared to undertake without proper financing.
2. For simplicity, I use only 5 taxonomic categories (class, order, family, genus and species).
3. I use a conservative approach to proposed taxonomic changes, particularly to species splits and descriptions, which I usually do not incorporate until I have time to review the evidence. There are more than a few recent proposals that I haven't had time to review, and some that I have simply missed.
4. I do not recognize splits based on Phylogenetic and Conservation Species Concepts. The former is largely synonymous with subspecies concept and usually leads to unfalsifiable runaway splitting, while the latter (now prevalent in primatology) has nothing to do with science at all. I also don't usually recognize splits based on just one character, such as mtDNA difference (which often results from otherwise insignificant ancient hybridisation events), chromosomal number (now known to be variable in many species), size (or poorly encoded "character space", which is often the same thing), minor difference in dentition, facial markings (particularly in primates), dialect difference (including call frequency in bats), or horn shape.
5. There are a few other cases where my opinion differs from the current majority views. For example, I see no reason to keep echydnas and the platypus in the same order while splitting marsupials and placentals into so many.
6. Many, but not all, synonyms are listed after equality signs. That includes many subspecies that in various times were proposed to be full species, but with insufficient justification (in my opinion).
7. **X** means that the taxon is extinct with more than 75% probability (in my estimate).
8. The list currently includes 5210 extant or recently extinct species, 1109 genera, 147 families and 29 orders.
